IT 101 Introduction to Computing

Final Project: AI-Assisted Information System Development

I. Project Overview

For the final project, you will design and develop a simple Information System (IS) that addresses the needs of an individual, group, organization, school, business, or community. The Information System may be developed for any appropriate purpose, such as recording information, managing transactions, monitoring activities, generating reports, organizing records, or assisting users in performing routine tasks.

You are encouraged to use Artificial Intelligence (AI) tools throughout the development process. You may develop any appropriate Information System, provided that the system performs a meaningful function and involves the processing, storage, retrieval, or presentation of information.

However, the purpose of the project is not simply to allow AI to create the system for you. The primary goal is for you to experience and understand how AI can assist in the process of designing, developing, testing, and improving an Information System.

You are therefore expected to demonstrate both:

1. A functional Information System; and
2. A clear understanding of what you learned while developing the system with the assistance of AI.

The project will be graded using the following distribution:

1. Information System 50 points
    (a) The Process: 25 pts
    (b) The Product: 25 pts
2. Reflection Paper 50 points

Total: 100 points

NOTE: The project does not need to be highly complex. A smaller but functional and understandable system is preferable to a complicated system that you yourselves cannot explain.

After completing the Information System, you must write an individual Reflection Paper discussing what you learned from developing the system with the assistance of AI.

II. Information System

A. The Process: Software Development Process Documentation (25 Points)

For this component, you are required to document how you developed your Information System from beginning to end.

The purpose of this documentation is to show the actual development process, including how the group identified the problem, planned the system, designed it, developed it, used AI, tested it, encountered problems, revised it, and completed the final version.

The documentation should not simply describe the finished system. It should show the sequence of activities and decisions that led to the development of the system.

You may use screenshots, diagrams, tables, notes, sample prompts, draft designs, test results, and other appropriate evidence.

B. The Product (25 pts)

The Product refers to the actual working Information System developed by your group. The system must perform a meaningful function related to the problem identified by your group.

Major system features should function correctly during the demonstration. A complicated system is not required. A simple system that functions correctly and can be clearly explained is preferable to an advanced system that the developers do not understand.
